Redistribution layers (RDLs) are the copper metal interconnects that electrically connect one part of the semiconductor package to another. RDLs are measured by line and space, which refer to the width and pitch of a metal trace. Higher-end RDLs may be at 2 μ m line/space and smaller. The RDL is a layer of wiring metal interconnects... » read more

Redistribution Layers (RDLs) - Semiconductor Engineering

The scan cells are linked together into “scan chains” that operate like big shift registers when the circuit is put into test mode. The scan chains are used by external automatic test equipment (ATE) to deliver test pattern data from its memory into the device. After the test pattern is loaded, the design is placed back into functional mode and the test response is captured in one or more ...
