In epidemiology, the attack rate is the percentage of an at-risk population that contracts the disease during a specified time interval. It is used in hypothetical predictions and during actual outbreaks of disease. An at-risk population is defined as one that has no immunity to the attacking pathogen which can be either a novel pathogen or an established pathogen.

Attack rate - Wikipedia

Knowledge of p-values and CIs is sufficient to allow accurate interpretation of the results of epidemiologic studies for beginning epidemiology students. p-values. When conducting scientific research of any kind, including epidemiology, one begins with a hypothesis, which is then tested as the study is conducted.
