Particle filters or Sequential Monte Carlo methods are a set of Monte Carlo algorithms used to solve filtering problems arising in signal processing and Bayesian statistical inference.The filtering problem consists of estimating the internal states in dynamical systems when partial observations are made, and random perturbations are present in the sensors as well as in the dynamical system.

Monte Carlo Dropout: model accuracy. Monte Carlo Dropout, proposed by Gal & Ghahramani (2016), is a clever realization that the use of the regular dropout can be interpreted as a Bayesian approximation of a well-known probabilistic model: the Gaussian process. We can treat the many different networks (with different neurons dropped out) as Monte Carlo samples from the space of all available ...

In statistics, resampling is any of a variety of methods for doing one of the following: . Estimating the precision of sample statistics (medians, variances, percentiles) by using subsets of available data (jackknifing) or drawing randomly with replacement from a set of data points (bootstrapping); Permutation tests (also re-randomization tests) are exact tests: Exchanging labels on data ...
